 This is the lorf2 protein of a strain of Chlamydia pneumoniae. Comparison of this sequence as to the recently published genome sequence of C. pneumoniae reveals that the sequence actually contains at least two open reading frames, a first one in the 5' portion and a second one in the 3' portion of the sequence. Despite the presence of the stop codon at the end of this sequence, c. pneumoniae does make a 76 kba product. It appears possible that C. pneumoniae is able to read through this stop codon and produce a full-length product terminated by the stop codon at the end of the second open reading frame. There is at least one in-frame ATG upstream of the start codon. This suggests that the first open reading frame may form part of one or more larger open reading frames when lotted to the start codon. This suggests that the first open reading frame way form part of one or more larger open reading frames. The lorfz protein or DNA can be used as a vacche for humans to treat or prevent disease caused by Chlamydia infection. The sequences or an antibody to lorfz can be used to diagnose a Chlamydial infection.
 Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.

AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or phermofits. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

 AAX36754-Y37949 are encoded by open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. This polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholnitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.

 AAV81501 to AAV81679 represent specifically claimed protein sequences isolated from Streptococcus pneumoniae. AAA05407 to AAA05590 represent specifically claimed nucleotide sequences isolated from S. pneumoniae. The sequences have antibacterial and antibilammatory properties.

The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be useful as immunogens diagnostic assays. The proteins and nucleotides can be useful for the detection and diagnosts of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitis. AAA05591 to AAA05614 represent primers used in the exemplification of the present invention.
 New Streptococcal protein, useful as a vaccine, for diagnosis of pneumococcal diseases and for screening agents capable of antagonizing or inhibiting expression of the protein

synthase (HMG-CoA synthase) enzyme, and is encoded by the hmc gene. The enzyme is involved in the mevalonate pathway in the carotenogenic yeast Phaffia rhodozyma. The specification also describes enzymes that are involved in the pathway from isopententy pyrophosphate to farnesyl pyrophosphate. The enzymes of the invention are used in the production of isoprenoids and carotenoids, especially astaxanthin. Astaxanthin is useful for the pharmaceutical industry, to protect cells against cancer as it has a strong antioxidation property. Astaxanthin is also useful as a colouring reagent in the farmed fish industry, e.g. salmon.

Annology to Tepreson uncertain activity and therefore epidermidis.

(II), given in AAG81454 to AAG8120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used to accination. The nucleic acids (I) may be used to produce the sepidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the AH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AH455091 to AH55090 represent olygonacleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequences are given in the disclosure for SEQ ID NO:4454 so even though sequences are present for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,

AAH55304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the s. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polyuncleotide sequences from the present invention. AAH55091 to AAH55098 represent oligonucleotide sequences and primers which are used to be accounted to the present invention.
 N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SBQ ID NO:4454 so even though sequences are given in the disclosure for SBQ ID NO:4465 to 4472, no sequences are present for SBQ ID NO:4455 to 4464.

 This DNA sequence codes for the major outer membrane protein (WOMI see AAW98187) of Chlamydia psittaci strain B577. A claimed MOMP polypeptide (see AAW98184) comprises regions VD3 and VD4 of MOMP i.e. it lacks regions VD1 and VD2. A claimed vaccine composition includes the MOMP polypeptide, optionally fused to a maltose binding protein.
 encoding the polypeptide, a vector, and a method of preventing C. psittaci infection by administering the vaccine containing the MOMP polypeptide. Vectors encoding MOMP polypeptides lacking the regions VDI and VD2 are useful for genetic vaccination. The vaccines are used to prevent C. psittaci infection, especially in birds.

This DNA sequence codes for the major outer membrane protein (MOMP, see AAW98187) of Chlamydla psittaci strain 6BC. Claimed MOMP polypeptides (see AAW98183 and AAW98184) comprise regions VD3 and VD4 of an MOMP, i.e. they lack regions VD1 and VD2. Claimed vaccine compositions include such MOMP polypeptides, optionally fused to a maltose binding protein. Also claimed are isolated nucleic acids encoding the polypeptide, a vector, and a method of preventing C.

This DNA sequence codes for the major outer membrane protein (MOMP, see AAM98187) of Chlamydia psittaci strain LSUWTCK, a cockatiel isolate (the MOMP gene sequence of this isolate is identical to that of C. psittaci Avian Type C.). A claimed MOMP polypeptide (see AAM98183) comprises regions VD3 and VD4 of MOMP, i.e. it lacks regions VD1 and VD2. A claimed vaccine composition includes MOMP polypeptide lacking VD1 and VD2. A composition includes MOMP belypeptide lacking VD1 and VD2. Optionally fused to a maltose binding protein. Also claimed are an isolated nucleic acid

The present invention relates to new nucleic acid sequences and the proteins encoded by the nucleic acid sequences. The encoded proteins comprise an immunogenic portion of a Chlamydia antigen. The encoded proteins are useful for the serodiagnosis and treatment of Chlamydia infection. Chlamdiae are intracellular bacterial pathogens that are responsible for a wide variety of human infections. C. trachomatis infection is one of the most common sexually transmitted diseases and can lead to pelvic inflammatory disease (PID), resulting in tubal obstruction and infertility. Trachoma due to ocular infection with C. trachomatis is the leading cause of preventable blindness worldwide. C. pneumonia is a major cause of acute respiratory tract infections in humans and is also coronary heart disease. The present sequence is a nucleic acid sequence isolated in the present invention. thought to play a role in the pathogenesis of atherosclerosis

Isolated polypeptide for diagnosis and treatment of Chlamydia infection comprises immunogenic portion of Chlamydia antigen, which comprises amino acid sequence encoded by polynucleotide sequence

Chlamydia polypeptides and fusion proteins useful for preventing pelvic inflammatory disease, trachoma, acute respiratory tract infections, atherosclerosis and heart disease
 The present nucleotide sequence is provided in a specification relating to compounds and methods for the treatment and diagnosis of chiamydial infection. The compounds provided include polypeptides and fusion proteins comprising immunogenic portions of chiamydia antigens and DNA, sequences encoding such polypeptides. They are useful for yeachnating against chiamydial infection, which causes pelvic inflammatory disease, trachoma, acute respiratory tract infections,

This DNA sequence codes for a 42 kDa major outer membrane protein

(MOMP, see AAW73141) of Chlamydia trachomatis serovar L2. A library

c of chlamydial genomic DNA was produced in the phage lambda 1059

system. A lambda 1059 recombinant having a 9.2 kb insert was shown

to be homologous to lambda gtl1/L2/33 (see AAV62446) by Southern

c analysis and was used for endonuclease digestion mapping and

additional Southern analyses. 2 Contiguous fragments were

identified and these contained sufficient base pairs to encode the

C L2 MOMP gene product. These fragments were cloned into M13 for

DNA sequencing. Novel recombinant DNA constructs are provided for

the expression of a polypeptide having immunological activity

c corresponding to that of a naturally occurring MOMP of C.

trachomatis. Such polypeptides find use as reagents in the

detection of C. trachomatis, or antibodies to C. trachomatis, and

as vaccines against infection by C. trachomatis.
 5 tgcctgtagggaacccttctgatccaagcttattaattgatggtacaatatgggaaggtg 64
 rrope for detecting Chlamydia trachomatis - comprises polynucleotide fragment that hybridises to major outer membrane protein DNA or RNA
 hosts. A claimed probe for detecting C. trachomatis comprises a polynuclectide fragment that specifically hybridises to a DNA or sequence encoding C. trachomatis 38-45 kDa MOMP. The probe has a sequence which is complementary to at least 12 contiguous bases

RESULT

```
The present sequence represents DNA encoding the major outer membrane protein (MOMP) of Chlamydia trachomatis serovar L2. DNA obtained from C. trachomatis serovar L2 was partially digested with DNAse I and C inserted into the bacteriophage vector lambda-gil; a lambda-gil insert c inserted into the bacteriophage vector lambda-gil; a lambda-gil insert (AAA292752; ATCC #40157, referred to as lambda-gill; a lambda-gil insert contained which encodes a protein fragment (AAV81267) reactive with a pool of C. trachomatis-specific monoclonal antibodies. The lambda-gill/L2/33 insert sequence was also used to probe a chamydial genomic DNA phage lambda 1059 library, and the present sequence which encodes the full-length (hamydia trachomatis serovar L2 MOMP was identified. C. trachomatis is a human pathogen responsible for diseases such as trachomatis is a human pathogen responsible for the diseases such as trachomatis. The full-length recombinant MOMP or a fragment thereof is used to elicit the production of antibodies to a MOMP of Chlamydia trachomatis. MOMP proteins are also useful as immunoassay reagents (substitutes for native MOMP) for detecting C. trachomatis or mative MOMP) for detecting C. trachomatis or mative MOMP) for detecting C. trachomatis or mative MOMP) for detecting C. trachomatis or matinodies, for diagnosing infection, or as an immunoassay
 Chlamydia trachomatis major outer membrane protein (MOMP)
 New synthetic or recombinant polypeptide, useful for diagnosing preventing Chlamydia trachomatis infection, is immunologically equivalent to a major outer membrane protein
 antibody production; immunoassay; detection; vaccine; trachoma; inclusion conjunctivitis; pneumonia; lymphogranuloma venereum; mucous membrane genital tract infections; ds.

 The sequence is that encoding a major outer membrane protein (MOMP) of Chlamydia trachomatis. This polypeptide can be used in immunoassays, e.g. to detect Chlamydia trachomatis antibodises in blood, or can be used in vaccines. The polynucleotide can be labelled and used as a diagnostic probe.

Chlamydia trachomatis

C. trachomatis MOMP containing fusion protein nucleotide sequence #1

us-09-391-606-14.rng

```
ï
 The present invention describes fusion proteins (I) comprising at least part of a major outer membrane protein (MOMP) of Chlamydia trachomatis, at least one hydrophilic polypeptide having no immunoreactivity to human serum and their connected part. AAA08120 to AAA08125 encode specifically claimed examples of the fusion proteins given in AAY82388 (Chlamydia trachomatis antibody using (I) as the antigen. (I) is used for the diagnosis of Chlamydia trachomatis infectious diseases. The method can diagnose Chlamydia trachomatis infectious diseases precifically in a

"Fusion protein containing at least part of a major outer membrane protein (MOMP) of Chlamydia trachomatis; no stop codon given"
 The present invention describes fusion proteins (I) comprising at least part of a major outer membrane protein (MOMP) of Chlamydia trachomatis, at least one hydrophilic polypeptide having no immunoreactivity to human serum and their connected part. AAA08125 on AAA08125 encode specifically claimed examples of the fusion proteins given in AAY82388 (Chlamydia trachomatis antibody using (I) as the antigen. (I) is used for the diagnosis of Chlamydia trachomatis infectious diseases. The method can diagnose Chlamydia trachomatis infectious diseases specifically in a

 This DNA sequence codes for a major outer membrane protein (MOMP)

cockatiel isolate (the MOMP gene sequence of this isolate is

cockatiel isolate (the MOMP gene sequence of this isolate is

identical to that of C. psittaci Avian Type C). The MOMP

colypeptide comprises regions VD3 and VD4 of native MOMP. See

also AAW98187), i.e. it lacks regions VD1 and VD2 of MOMP. DNA

encoding the MOMP polypeptide was obtained by PCR amplification

(see also AAX25049 and AAX25051) of C. psittaci LSUWTCK DNA. A

claimed vaccine composition includes this MOMP polypeptide,

coptionally fused to a maltose binding protein. Also claimed

an isolated nucleic acid encoding the polypeptide, a vector,

and a method of preventing C. psittaci infection by administering

the vaccine containing the MOMP polypeptide. Vectors ancoding MOMP

polypeptides lacking regions VD1 and VD2 are useful for genetic

(naked nucleic acid) vaccination. The vaccines are used to prevent

C. psittaci infection, especially in birds.

The present sequence represents the complete genome of Chlamydia trachomatis. Open reading frames (ORFS) of the genome encode polypeptides AAY36754-Y37949. The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonecoccal uretritis, pentralis, cervicitis, salpingitis, penthapatitis, bartholinitis; peneumopathy in breast feeding infants; and veneral lymphographlomatosis. The polypeptides of the invention may be of use in

 358
 DNA obtd. from C.trachomatis serovar L2 was partially digested with DNAse I and inserted into vector lambda gtll. Clone lambda gt/l1/L2/ 333 (AAN60006) reacted with the pool and was subsequently shown to produce a polypeptide that displays species-, subspecies- and typerspecific epitopes of the chlamydial MOMP. L2 B9-F DNA (AAN60007) is comprised of lambda 1059 recombinants shown to be homologous with lambda gtll/L2/33.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 MISCELLANEOUS: THE COMMON LABORATORY STRAIN OF BACTERIOPHAGE LAMBDA; LAMBDA, THE ORGINAL ISOLATE. THE UR-LAMBDA YIRIONS HAVE THIN, JOINTED TALL FIBERS (SIDE TALL FIBERS) THAT ARE ABSENT FROM LAMBDA WILD TYPE. RELATIVE TO LAMBDA PAPA, UR-LAMBDA HAS EXPANNED RECEPTOR SPECIFICITY AND ADSORBS TO E.COLI CELLS MORE RAPIDLY.
 SIMILARITY: BELONGS TO THE TAIL FIBER FAMILY.
CAUTION: THIS IS A CONCEPTUAL TRANSLATION; A FRAMESHIFT WAS
CORRECTED IN POSITION TO 396 TO RECREATE THE ORIGINAL STF PRIOEIN.
